

VOLSHI

Infrastructure for autonomous intelligence

Investor overview

October 2026

Executive summary

VOLSHI builds infrastructure that helps organizations control and understand AI systems that take action.

The system connects authorization, evidence, execution records, and temporal memory. Teams can inspect what an agent was permitted to do, what supported its decision, and what happened during execution.

Current objective

Secure a paid design partner to validate one consequential agent workflow.

The operating problem

When an AI system takes action, operators need more than its final answer.

Authority

Which actions were allowed, and who approved them?

Evidence

What information supported the decision?

Execution

What did the system do, and what changed?

Time

What was known at the time, and what was learned later?

Product approach

VOLSHI places a control and evidence layer around agent workflows.

Authorize

Set boundaries before an agent acts.

Ground

Connect conclusions to evidence and provenance.

Execute

Route work through a controlled runtime.

Observe

Record events from tools, systems, and operators.

Reconstruct

Query what was recorded and what was believed over time.

System components

ARCHE	Allocates reasoning effort based on pressure and consequence.
BOUNCER	Applies authorization boundaries.
ERIE	Retrieves evidence and returns provenance with conclusions.
ELLE	Turns experience into scoped, reviewable rules.
TEMPE	Preserves recorded history while allowing knowledge to change.
ROSIE and PEEP	Connect local execution with observable events.

Technical progress and open work

Built

- Evidence retrieval and provenance pipeline
- Append-only temporal storage and deterministic replay
- Authorization and tenant-scoped access controls
- Runtime adapters and execution telemetry

Next

- Secure a paid design partner
- Validate one production-relevant workflow
- Measure operator value and deployment requirements
- Set pricing from buyer evidence

Strong technical proof. Commercial proof remains the gap.

Business model

VOLSHI expects to sell software to organizations deploying AI agents in business workflows.

Initial engagement

Paid design partner work scoped to one consequential workflow.

Ongoing product

Recurring software use as a customer expands agent coverage.

Validation needed

Buyer, deployment model, pricing, and conversion assumptions.

No revenue, customer count, or market-size figures are asserted here.

Design partner engagement

Work with VOLSHI on one real agent workflow where action requires clear boundaries and an accountable record.

- 1 Select a workflow and operator.
- 2 Map permissions, evidence sources, and failure paths.
- 3 Instrument execution and review.
- 4 Evaluate control, traceability, and operational fit.
